2007 Surveillance Report

A Survey of the Health of Mothers and Babies in Los Angeles County

Comments from LA MomsLAMB constantly receives support from LA mothers.

Here are a few comments from LAMB moms:

"This survey is/was an excellent idea and will hopefully reinforce the link between healthy moms, healthy lifestyles, and healthy babies."

"I had a wonderful experience during my hospital stay when I gave birth. I am glad to have taken classes on breastfeeding. I was encouraged to keep trying even though my son was having difficulty latching. It is difficult to do, but extremely worth it. The support I received from my partner and hospital was amazing."

"It was too difficult to get prenatal care, and I didn't find out I was pregnant until 3 months later. I didn't get insurance until over a month later, and all doctors turned me away because I was "too far along" so I had to pay for ultrasounds and stuff, which was so expensive!"

"More support and information needs to be out there regarding depression. Mothers-to-be, fathers, and family members need to be educated prior to the delivery of the baby on what symptoms to look for. Thank you for including me in your survey. I hope it helps."

"After I gave birth, I was very, very depressed. My boyfriend helped a lot, but I still went a little crazy. It took about $1\frac{1}{2}$ months for me to get better."

"I hope that my information will be helpful to all of the new mothers. Thanks."

"I like this survey because it gives a different perspective on how we and doctors could do better when expecting a baby."

"I appreciate your concern for mothers and babies."

About the Los Angeles Mommy and Baby Project

The Los Angeles Mommy and Baby (LAMB) Project is a public health surveillance project developed by the Maternal, Child, and Adolescent Health Programs of Los Angeles County in 2005. The LAMB Project collects countywide population-based data on the attitudes and experiences of women before, during, and shortly after their most recent pregnancy.

The LAMB Project was piloted in 2004 in Antelope Valley to address the high infant mortality rate observed in that region of Los Angeles County. The LAMB Project provided information on the risk factors and potential causes of infant mortality for women in the Antelope Valley. Since 2005, the project has been expanded to cover all of Los Angeles County, collecting data roughly every other year.

Purpose

The purpose of LAMB is to improve the health of mothers and infants by reducing adverse birth outcomes and the risk factors that lead to high rates of low birth weight, pre-term births, and infant and maternal mortality and morbidity. LAMB provides data for county health officials and community partners to use in order to make decisions designed to improve the health of mothers and infants.

LAMB allows the LA County Department of Public Health to monitor trends over time and examine changes in maternal and child health indicators, including rates of unintended pregnancy, prenatal care, smoking and drinking during pregnancy, breastfeeding, well-baby checkups, infant illnesses, baby's sleep position, and exposure to secondhand smoke. LAMB data provides a context in which to better interpret the information from birth certificates used to plan state and local maternal, child, and infant health programs.

Using the LAMB 2007 Data Book

This data book presents findings from the 2007 LAMB project. Surveyed were 6,264 eligible respondents, which represented 151,813 live births in Los Angeles County during 2007. The data are weighted by the respondents' selection probability, which allows the percentage (prevalence) reported in this document to represent the entire population of live births in the County of Los Angeles in the year 2007.

Research has indicated that various maternal behaviors and experiences before, during, and after pregnancy influence birth outcomes. Through the release of this report, the Maternal, Child, and Adolescent Health Programs hopes that these data can be used to monitor and assess trends, to plan and evaluate programs, and to direct policy decisions, with the ultimate goal of improving the health of mothers and infants in Los Angeles County. The LAMB Project recommends that readers review the Technical Notes section of this report, which includes the methodology and details of the sampling, data weighting, response rate, strengths and limitations of the data, and a glossary of maternal and infant health terms.

The LAMB 2007 Surveillance Report covers a wide range of health topics, including

- Preconception health (health before pregnancy)
- Prenatal care and maternal medical conditions during pregnancy
- Psychosocial conditions during pregnancy
- Behavioral risk factors
- Postpartum care and infant health.

Each section of the report contains tables displaying estimates by Race/Ethnicity, Service Planning Area (SPA), and Supervisorial District. In every table, county-level estimates are provided so that comparisons may be made between subpopulations and the county total.

To address uncertainty about each estimate, the Relative Standardized Error (RSE) was calculated to determine the stability of each estimate. An asterisk (*) next to an estimate cautions the reader that the estimate is statistically unstable and therefore may not be appropriate to use for planning or policy purposes.

^{*}Signifies that the estimate is statistically unstable (relative standard error > 25%) and therefore may not be appropriate to use for planning or policy purposes.

⁴Question asked: During your first or second prenatal care visit, were these part of your visit? Blood pressure measured, urine sample given, blood sample taken, height and weight measured, had pelvic exam, health history taken, ultrasound done, doctor asked about prenatal lead exposure. Those who responded "No" to any of the first six items were recoded as "PHS guidlines not met."

⁷Questions in this section were only asked survey versions used in Waves 2-4.

⁶Question asks: How often does your new baby sleep in the same bed with you or anyone else? Those who responded "Always", "Frequently", or "Sometimes" were recoded as "Ever slept with another person."

Technical Notes

I. Methods

LAMB follows the Centers for Disease Control and Prevention (CDC) Pregnancy Risk Assessment Monitoring System (PRAMS) methodology¹ to collect data. Women were selected from birth records. Selected mothers are first contacted by mail. If there is no response to repeated mailings, women are contacted and interviewed by telephone. The survey can be administered in English, Spanish, and Chinese, with translators available for other languages. In addition, an informational packet with resources and information about 211 is sent along with the survey.

II. Sampling

The 2007 LAMB is a population-based survey with multi-level clustered sampling and an over-sample of low birth weight and pre-term births, additional participants were sampled by Service Planning Area (SPA) and race/ethnicity to ensure an adequate sample for race by SPA analysis.

III. Data Weighting

To get a representative picture of the mothers who gave birth in Los Angeles County in 2007, the data were weighted by SPA and race/ethnicity. Specifically, raking procedures²⁻⁴ were used to properly weight the sample and account for the multiple sampling frames.

IV. Response Rate

There were 6,264 mothers who responded to the 2007 LAMB survey, resulting in a response rate of 56%, based on calculations proposed by the American Association for Public Opinion Research (AAPOR).⁵

V. Statistical Methods

Point estimates and their variances were calculated using the SAS, PROC SURVEYFREQ procedures, (Release 9.2, North Carolina) to account for the complex sample design. Except those provided with an asterisk, all estimates shown met the National Center for Health Statistics (NCHS) standard of having less than or equal to 25% relative standard error. The approach for presenting point estimates and their variability is adapted from the NCHS; the relative standard error is the standard error of the estimate divided by the estimate itself. Details of NCHS guidelines are available at http://www.cdc.gov/nchs/products/pubs/pubd/hestats/ children2005/children2005.htm (accessed Feb. 27, 2006).

Relative Standard Error (RSE) is calculated by "dividing the standard error of the estimate by the estimate itself, then multiplying that result by 100. Relative standard error is expressed as a percent of the estimate. For example, if the estimate of cigarette smokers is 20 percent and the standard error of the estimate is 3 percent, the RSE of the estimate = (3/20) * 100, or 15 percent.^{6,7}" In this report, RSE >25% is used as the criterion for determining that the estimate is statistically unstable and therefore may not be appropriate to use for planning or policy purposes.

All missing and unknown response values were excluded from individual calculations where applicable.

VI. Strengths and Limitations

Strengths: LAMB a population-based survey allowing generalization to all women with live birth. Limitations: Sample sizes for some subpopulations were too small for precise estimates. If presented, these are indicated by an Asterisk. Potential sources of bias include non-response, recall, and non-coverage. The data can only be generalized to LAC residents who delivered live infants in the year 2007.

VII. Glossary

Unwanted/mistimed pregnancy: just before becoming pregnant, wanting to be pregnant later (i.e. mistimed) or not wanting to be pregnant then or at any time in the future (i.e. unwanted).

Preterm Birth: an infant born before 37 weeks of gestation. Respondents were considered to be overweight if their Body Mass Index (BMI) was 26.0-29.0, and obese if their BMI was >29.0. Respondents' BMI was calculated on the basis of their self-reported pre-pregnancy height and weight.

Low Birth Weight: an infant weighing less than 2500 grams or 5 pounds 8 ounces at birth.

Meeting the PHS prenatal care guidelines: meeting all the recommendations of the Public Health Service Expert Panel on the Content of Prenatal Care (1989), including having blood pressure measured, urine and blood samples taken, height and weight measured, a pelvic exam, and a health history taken.

Depressed during pregnancy: feeling depressed for most of the day for two weeks or longer during pregnancy.

Acknowledgments

The LAMB Project is grateful to all of the Los Angeles County mothers who took the time to complete the survey.

The information gathered will provide a more thorough understanding of the health of mothers and babies in Los Angeles County. Maternal, Child, and Adolescent Health Programs would like to thank all of the interns who have contributed their time and effort to the 2007 LAMB Project.

This project is made possible by the Health Resources and Services Administration (HRSA) #R40MC06635 and MCAH General grants and the Productivity Investment Fund (PIF), County of Los Angeles Quality and Productivity Commission.
